

Innovative Technologies

Innovative technologies are encouraged and should be accepted providing there is sufficient documentation as to the effectiveness and reliability of the proposed structure. To justify the efficiency of innovated water quality control structures, the owner may be required to monitor the pollutant removal efficiency of the structure. If satisfactory results are obtained, the innovative water quality structure may be used and no other monitoring studies should be required. If the control is not sufficient, other on-site and/or downstream controls should be designed to trap the required pollutants.
