

Cathodic Protection (For Galvanic Systems)

Description of Galvanic Cathodic Protection:

A Galvanic Cathodic Protection System uses anodes attached to the underground storage tank system to protect it from corrosion. The anode is a more reactive metal than the tank system and corrodes in place of the tank system.

Operating and Maintaining the Cathodic Protection System:

- At least once every three years (before the due date), have a cathodic protection system test performed by a qualified cathodic protection tester to ensure the system is adequately protecting the tanks and/or lines.

Record Keeping:

- The results of the two most recent cathodic protection system test must be kept.

If the Galvanic Cathodic Protection System test ever fails, report the results to the Division of UST Management at (803) 896-7957.
