Potential agent of bioterrorism

1. An outbreak is the occurrence of more cases of disease than normally expected within a specific place or group of people over a given period of time. Clinical specimens may be required.
2. Antibiotic resistant organisms: resistant pneumococcus - MIC > 2 µg/ml of penicillin G (or Oxacillin disc zone <19 mm) or resistance to any single drug accepted as effective treatment. The definition of resistance may differ between laboratories by test methods used to determine susceptibility. Reports should specify the site from which the isolate was obtained and the drug susceptibility profile.
3. Invasive disease = isolated from normally sterile site: blood, bone, CSF, joint, pericardial, peritoneal or pleural fluid, protected bronchial sampling, or from lung aspirate/biopsy, necrotizing fasciitis, and cellulitis only if isolate is from a tissue biopsy. Always specify site of isolate.
4. Report Gram-negative diplococcus in blood or CSF.
5. Labs are requested to submit these isolates, positive serologies, or specimens to the DHEC Bureau of Laboratories for confirmatory testing and genotyping.

* Preliminary results are defined as gram stain results that may be indicative of an immediately or urgently reportable condition.
