

Flu Watch

South Carolina Department of Health and Environmental Control Division of Acute Disease Epidemiology

Week Ending October 29, 2011 (MMWR Week 43)

All data are provisional and may change as more reports are received.

In this issue:

ILINet	2
Virologic surveillance	4
Rapid antigen tests	7
Hospitalizations and deaths	9
Activity level definitions	11
SC influenza surveillance	12
components	
National influenza surveillance	13

MMWR Week 43 at a Glance:

Influenza Activity Level: No activity

Note: Activity level definitions are found on page 7

ILI Activity Status (South Carolina baseline is 2.05%*): Below baseline in the Upstate (0%), Midlands (.17%), and along the Coast (.72%). The state ILI percentage is .20%. These data reflect reports from 11 (34.4%) providers.

Note: See map of counties on page 3 for regional descriptions

SC Viral Isolate and RT-PCR Activity: No positive specimens were reported by any lab.

Positive Rapid Flu Test Activity: Nineteen positive rapid tests were reported. Sixty-one positive rapid tests have been reported this season.

Hospitalizations: Two lab confirmed hospitalization were reported. Four lab confirmed hospitalizations have been reported this season. Lab confirmation includes positive rapid tests, culture, PCR, DFA, or IFA.

Deaths: No lab confirmed deaths were reported. *Lab confirmation includes positive rapid tests, culture, PCR, DFA, or IFA.*

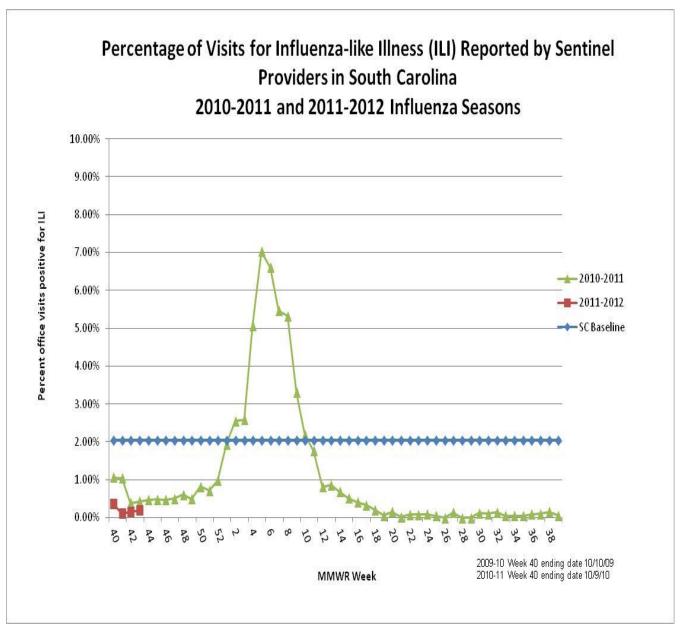

**Note: Additional charts and/or graphs will be presented as the season

Summary of ILI Activity, Positive Confirmatory Tests, and Influenza Associated Hospitalizations and Deaths

	Current week	Previous week	Change From previous week
Percent of visits to ILINet providers for ILI	.20	.16%	▲.04
Number of positive confirmatory tests	0	0	0
Number of lab confirmed flu hospitalizations	2	1	1
Number of lab confirmed flu deaths	0	0	0

I. ILINet Influenza-Like Illness Surveillance

During MMWR week 43, .20% of patient visits to SC ILINet providers were due to ILI. This is below the state baseline **(2.05%)**. This ILI percentage compares to .43% this time last year. Reports were received from providers in 10 counties, representing 6 of the 8 regions.

^{*}The SC baseline is the mean percentage of patient visits for ILI during non-influenza weeks (weeks when percent of positive lab tests was below 20%) for the previous three seasons plus two standard deviations.

Reported Influenza-Like Illness by Sentinel Providers October 23, 2011 - October 29, 2011

County	ILI %	County	ILI %
Abbeville		Greenwood	NR
Aiken	0%	Hampton	NR
Allendale		Horry	NR
Anderson	0%	Jasper	NR
Bamberg		Kershaw	0%
Barnwell		Lancaster	
Beaufort	NR	Laurens	NR
Berkeley	NR	Lee	
Calhoun		Lexington	NR
Charleston	NR	Marion	
Cherokee		Marlboro	
Chester		McCormick	NR
Chesterfield		Newberry	
Clarendon		Oconee	
Colleton		Orangeburg	
Darlington		Pickens	NR
Dillon	NR	Richland	08%
Dorchester	NR	Saluda	0%
Edgefield		Spartanburg	0%
Fairfield	.80%	Sumter	NR
Florence	.45%	Union	
Georgetown	NR	Williamsburg	
Greenville	.72%	York	0%

NR: No reports received ---: No enrolled providers

Geographic Region	ILI %	# of Reporters
Upstate-Regions 1 -2	0	4
Midlands-Regions 3-5	.17	6
Coastal-Regions 6-8	.72	1

^{*}County ILI percentages are affected by the number of reporting providers within that county.

Positive confirmatory influenza test results* Current MMWR Week (10/23/11 - 10/29/11)

III. Positive Rapid Antigen Tests

During MMWR week 43, 19 positive rapid antigen test were reported. Of these, there were 13 influenza A, 3 influenza B, and 3 influenza A/B. During this MMWR week last year, 50 were reported.

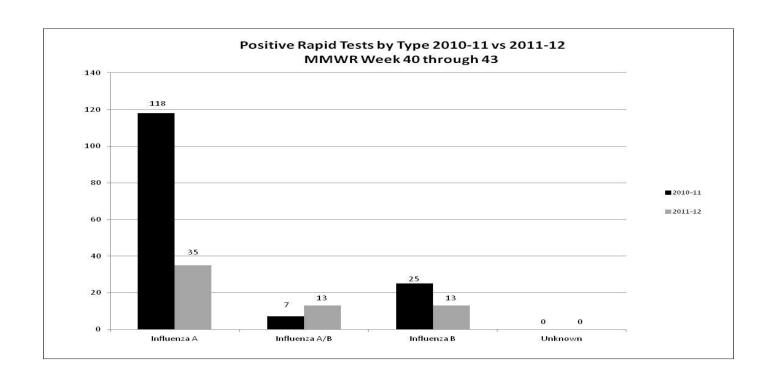

Positive Rapid Flu Tests by County Current Week 10/23/11 – 10/29/11

County	Positive Tests	County	Positive Tests	County	Positive Tests
Abbeville	1	Dillon		Lexington	1
Aiken		Dorchester	3	Marion	
Allendale		Edgefield		Marlboro

IV. Influenza hospitalizations and deaths

During MMWR week 43 two lab confirmed* influenza hospitalizations were reported. No lab confirmed deaths were reported.

	Total number*			
Number of Hospitals Reporting (current week)	36			
	Current MMWR (10/23 - 10/29/11)	Cumulative (since 10/2/10)		
Hospitalizations	2	4		
Deaths	0	0		

^{*}These data are provisional. Lab confirmation for hospitalizations and deaths includes culture, PCR, DFA, IFA, and rapid test.

V. Influenza activity levels

Activity Level	ILI activity/Outbreaks		Laboratory data
No activity	Low	And	No lab confirmed cases
	Not increased	And	Isolated lab-confirmed cases
Sporadic			OR
	Not increased	And	Lab confirmed outbreak in one institution
	Increased ILI in 1 region; ILI activity in other regions is not increased	And	Recent (within the past 3 weeks) lab evidence of influenza in region with increased ILI
			OR
Local	2 or more institutional outbreaks (ILI or lab confirmed) in 1 region; ILI activity in other regions is not increased	And	Recent (within the past 3 weeks) lab evidence of influenza in region with the outbreaks; virus activity is no greater than sporadic in other regions
	Increased ILI in 2-3 regions	And	Recent (within the past 3 weeks) lab confirmed influenza in the affected regions
Regional			OR
	Institutional outbreaks (ILI or lab confirmed) in 2-3 regions	And	Recent (within the past 3 weeks) lab confirmed influenza in the affected regions
Widespread	Increased ILI and/or institutional outbreaks (ILI or lab confirmed) in at least 4 of the regions	And	Recent (within the past 3 weeks) lab confirmed influenza in the state.

VI. South Carolina Influenza Surveillance Components

South Carolina influenza surveillance consists of mandatory and voluntary reporting systems for year-round influenza surveillance. These networks provide information on influenza virus strain and subtype and influenza disease burden.

Mandatory Reporting

Positive confirmatory test reporting

Positive influenza culture, PCR, DFA, and IFA results from commercial laboratories should be reported to DHEC within 7 days electronically via CHESS or using a DHEC 1129 card.

Positive rapid antigen test reporting

Summary numbers of positive rapid influenza tests and influenza type identified should be sent to the Uregional U health department by fax or email before noon on Monday for the preceding week.

Influenza death reporting

Lab confirmed influenza deaths in adults should be reported to DHEC within 7 days. Lab confirmed influenza deaths in children under age 18 should be reported within 24 hours. These include results from viral culture, PCR, rapid flu tests, DFA, IFA or autopsy results consistent with influenza. Hospitals should report deaths to their regional health department by noon on Monday for the preceding week.

Influenza hospitalizations

DHEC requires weekly submission of laboratory confirmed influenza hospitalizations. Hospitals should report these to their <u>regional</u> health department by noon on Monday for the preceding week.

For additional information about ILINet or to become an ILINet provider, contact the Acute Disease Epidemiology influenza surveillance coordinator at springcb@dhec.sc.gov.

Voluntary Networks

Laboratory Viral Isolate Network

Viral isolate surveillance is essential for identifying circulating influenza strain subtype information, and the identification of new strains that may need to be included in the next year's influenza vaccine. Participating providers receive culture media, packaging, processing and shipping labels in order to submit a subset of specimens to the Bureau of Labs (BOL).

UInfluenza-Like Illness (ILINet) Sentinel Providers Network ILINet focuses on the number of patients presenting with influenza-like symptoms in the absence of another known cause. ILI is defined as fever (temperature of U≥U100°F) plus a cough and/or a sore throat in the absence of another known cause. Providers submit weekly reports to the CDC of the total number of patients seen in a week and the subset number of those patients with ILI symptoms by age group.

South Carolina Disease Alerting, Reporting & Tracking System (SC-DARTS)

SC-DARTS is a collaborative network of syndromic surveillance systems within South Carolina. Currently our network contains the following data sources: SC Hospital Emergency Department (ED) chief-complaint data, Poison Control Center call data, Over-the-Counter (OTC) pharmaceutical sales surveillance, and CDC's BioSense Biosurveillance system. The hospital ED syndromic surveillance system classifies ED chief complaint data into appropriate syndrome categories (ex: Respiratory, GI, Fever, etc.). These syndrome categories are then analyzed using the cumulative sum (CUSUM) methodology to detect any significant increases. Syndromic reports are distributed back to the hospital on a daily basis.

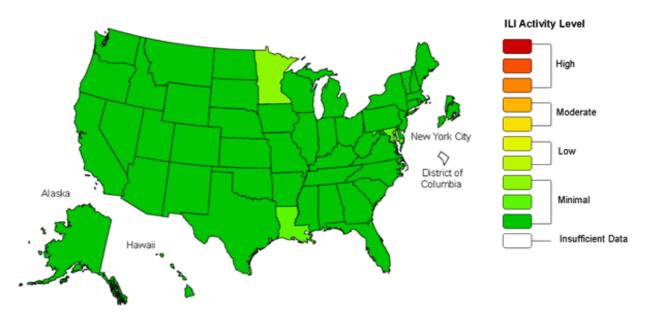

VII. National Surveillance MMWR Week 42 (10/16-10/22)

During week 42 (October 16-22, 2011), influenza activity remained low in the United States.

- <u>Viral Surveillance</u>: Of the 1,479 specimens tested by U.S. World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NREVSS) collaborating laboratories and reported to CDC/Influenza Division, 12 (0.8%) were positive for influenza.
- Pneumonia and Influenza (P&I) Mortality Surveillance: The proportion of deaths attributed to P&I was below the epidemic threshold.
- o Influenza-associated Pediatric Mortality: No influenza-associated pediatric deaths were reported
- Outpatient Illness Surveillance: The proportion of outpatient visits for influenza-like illness (ILI) was 1.1%, which is below the national baseline of 2.4%. All 10 regions reported ILI below region-specific baseline levels. All 50 states and sNew York City experienced minimal ILI activity and the District of Columbia had insufficient data.
- Geographic Spread of Influenza: The geographic spread of influenza in the District of Columbia, Puerto Rico, the U.S. Virgin Islands, and 18 states was reported as sporadic and Guam and 32 states reported no influenza activity.

For more information, please visit http://www.cdc.gov/flu/weekly/.

Influenza-Like Illness (ILI) Activity Level Indicator Determined by Data Reported to ILINet 2011-12 Influenza Season Week 42 ending Oct 22, 2011

^{*}This map uses the proportion of outpatient visits to health care providers for influenza-like illness to measure the ILI activity level within a state. It does not, however, measure the extent of geographic spread of flu within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels.

*Data collected in ILINet may disproportionately represent certain populations within a state, and therefore, may not accurately depict the full picture of influe activity for the whole state.	nza
