
Summary

CDC has updated its interim guidance for U.S. health care providers caring for women of reproductive age with possible Zika virus exposure (1) to include recommendations on counseling women and men with possible Zika virus exposure who are interested in conceiving. This guidance is based on limited available data on persistence of Zika virus RNA in blood and semen (2–5). Women who have Zika virus disease should wait at least 8 weeks after symptom onset to attempt conception, and men with Zika virus disease should wait at least 6 months after symptom onset to attempt conception. Women and men with possible exposure to Zika virus but without clinical illness consistent with Zika virus disease should wait at least 8 weeks after exposure to attempt conception. Possible exposure to Zika virus is defined as travel to or residence in an area of active Zika virus transmission (http://www.cdc.gov/zika/geo/active-countries.html), or sex (vaginal intercourse, anal intercourse, or fellatio) without a condom with a man who traveled to or resided in an area of active transmission. Women and men who reside in areas of active Zika virus transmission should talk with their health care provider about attempting conception. This guidance also provides updated recommendations on testing of pregnant women with possible Zika virus exposure.

Update: Interim Guidance for Prevention of Sexual Transmission of Zika Virus

Summary

CDC issued interim guidance for the prevention of sexual transmission of Zika virus on February 5, 2016 (1). The following recommendations apply to men who have traveled to or reside in areas with active Zika virus transmission and their female or male sex partners. These recommendations replace the previously issued recommendations and are updated to include time intervals after travel to areas with active Zika virus transmission or after Zika virus infection for taking precautions to reduce the risk for sexual transmission. This guidance defines potential sexual exposure to Zika virus as any person who has had sex (i.e., vaginal intercourse, anal intercourse, or fellatio) without a condom with a man who has traveled to or resides in an area with active Zika virus transmission.

Zika virus can be sexually transmitted from a man to his sex partners. Zika virus infection is of particular concern during pregnancy. The first documented case of sexual transmission of Zika virus was in 2008 (2); transmission was from a man to a woman, and sexual contact occurred a few days before the man’s symptom onset. The first case of sexual transmission associated with the current outbreak was reported
in early February (Dallas County Health and Human Services, unpublished data, 2016). In late February
2016, CDC reported two additional confirmed cases of sexual transmission of Zika virus from men
returning from areas with active Zika virus transmission to their sex partners in the United States; these
transmissions occurred in early 2016 (3). As of March 18, 2016, CDC has reported three additional cases,
for a total of six confirmed cases of sexual transmission in the United States associated with this
outbreak. Another recent report described a case of sexual transmission that occurred in Italy in 2014
(4). In addition, there have been two reports of replication-competent Zika virus isolated from semen at
least 2 weeks after onset of illness; blood plasma specimens collected at the same time as the semen
specimens tested negative for Zika virus by reverse transcription—polymerase chain reaction (RT-PCR)
(5,6). Semen collected from a third man with Zika virus infection had virus particles detectable by RT-PCR
at 62 days after fever onset; RT-PCR of blood at that time was negative (7). Because serial semen
specimens were not collected for these three cases, the duration of persistence of infectious Zika virus in
semen remains unknown.

All reported cases of sexual transmission involved vaginal or anal sex with men during, shortly before
onset of, or shortly after resolution of symptomatic illness consistent with Zika virus disease. It is not
known whether infected men who never develop symptoms can transmit Zika virus to their sex partners.
Sexual transmission of Zika virus from infected women to their sex partners has not been reported.
Sexual transmission of many infections, including those caused by other viruses, is reduced by consistent
and correct use of latex condoms.

DHEC contact information for reportable diseases and reporting requirements

Reporting of Zika Virus is consistent with South Carolina Law requiring the reporting of diseases and conditions to your state or local public health department. (State Law # 44-29-10 and Regulation # 61-20) as per the DHEC 2016 List of Reportable Conditions available at: http://www.scdhec.gov/Library/CR-009025.pdf

Federal HIPAA legislation allows disclosure of protected health information, without consent of the individual, to public health authorities to collect and receive such information for the purpose of preventing or controlling disease. (HIPAA 45 CFR §164.512).

Categories of Health Alert messages:
- **Health Alert**: Conveys the highest level of importance; warrants immediate action or attention.
- **Health Advisory**: Provides important information for a specific incident or situation; may not require immediate action.
- **Health Update**: Provides updated information regarding an incident or situation; unlikely to require immediate action.
- **Info Service**: Provides general information that is not necessarily considered to be of an emergent nature.
