
Summary
An increasing number of COVID-19 cases caused by the novel coronavirus, named SARS-CoV-2, have been seen in the U.S. and throughout the world. Some areas of the U.S. have identified cases related to local transmission.

This DHEC Health Alert Network (HAN) Update provides updated guidance on evaluating and testing persons under investigation (PUIs) for COVID-19. It supersedes guidance provided in the DHEC/CDC HAN distributed on February 28, 2020.

While availability of testing is still limited, DHEC is providing guidance on how to consider testing for patients given the concern for local transmission. **DHEC cannot provide direct clinical services, and patients should not be directed to call DHEC for testing.** At this time, healthcare providers must evaluate the patient, then consult with DHEC about testing.

Providers who are receiving this alert from another party and are not registered to receive HANs should register at [https://apps.dhec.sc.gov/Health/SCHANRegistration/](https://apps.dhec.sc.gov/Health/SCHANRegistration/) if they wish to receive future updates through the HAN network.

Criteria to Guide Evaluation and Testing of Patients Under Investigation (PUI) for COVID-19

DHEC in consultation with clinicians, will determine whether a patient is a PUI for COVID-19. Providers should contact DHEC at the information provided below.

These clinical criteria for COVID-19 PUIs have been developed based on available information about this novel virus, and the changing epidemiology of COVID-19 infections. Testing may be considered for patients regardless of severity of illness based on the risk of potential exposure or absence of a more likely diagnosis for their symptoms. These criteria are subject to change as additional information becomes available.
Patients should be advised that testing means they will be considered a PUI and will be required to isolate at home (if not hospitalized) until results are returned. DHEC will contact them to collect initial information about possible exposures.

<table>
<thead>
<tr>
<th>Clinical Features</th>
<th>Epidemiologic Risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fever(^1) or signs/symptoms of lower respiratory illness (e.g., cough or shortness of breath)</td>
<td>AND Any person, including healthcare workers(^2), who has had close contact(^3) with a laboratory-confirmed(^4) COVID-19 patient within 14 days of symptom onset</td>
</tr>
<tr>
<td>Fever(^1) or signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath)</td>
<td>AND A history of travel to a country with a Level 3 travel notification(^5) (see below) or other well defined area with ongoing and sustained transmission within 14 days of symptom onset</td>
</tr>
<tr>
<td>Fever(^1) and signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath)</td>
<td>AND Absence of a more likely alternative diagnosis. At a minimum, providers should consider rule-out testing with a respiratory virus panel that includes influenza. Other elements in the patient's history that may increase likelihood of exposure, i.e. travel within or outside the U.S. should also be considered.</td>
</tr>
</tbody>
</table>

These criteria are intended to serve as guidance for evaluation. In consultation with your local public health departments, patients should be evaluated on a case-by-case basis to determine the need for testing. Testing may be considered for deceased persons who would otherwise meet the PUI criteria.

\(^1\) Fever may be subjective or confirmed.

\(^2\) For healthcare personnel, testing may be considered if there has been exposure to a person with suspected COVID-19 without laboratory confirmation. Because of their often extensive and close contact with vulnerable patients in healthcare settings, even mild signs and symptoms (e.g., sore throat) of COVID-19 should be evaluated among potentially exposed healthcare personnel. Additional information is available in CDC’s Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with Coronavirus Disease 2019 (COVID-19) (https://www.cdc.gov/coronavirus/2019-ncov/hcp/guidance-risk-assesment-hcp.html).

\(^3\) Close contact is defined as—

a) being within approximately 6 feet (2 meters) of a COVID-19 case for a prolonged period; close contact can occur while caring for, living with, visiting, or sharing a healthcare waiting area or room with a COVID19 case

- or -

b) having direct contact with infectious secretions of a COVID-19 case (e.g., being coughed on)
If such contact occurs while not wearing recommended personal protective equipment (PPE) (e.g., gowns, gloves, NIOSH-certified disposable N95 respirator, eye protection), criteria for PUI consideration are met.

Data to inform the definition of close contact are limited. Considerations when assessing close contact include the duration of exposure (e.g., longer exposure time likely increases exposure risk) and the clinical symptoms of the person with COVID-19 (e.g., coughing likely increases exposure risk, as does exposure to a severely ill patient). Special consideration should be given to healthcare personnel exposed in healthcare settings, as described in CDC’s Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with COVID-19 ([https://www.cdc.gov/coronavirus/2019-ncov/hcp/guidance-risk-assessment-hcp.html](https://www.cdc.gov/coronavirus/2019-ncov/hcp/guidance-risk-assessment-hcp.html)).

4Documentation of laboratory-confirmation of COVID-19 may not be possible for travelers or persons caring for COVID-19 patients in other countries.

**Recommendations for Reporting, Testing, and Specimen Collection**

Clinicians should immediately implement recommended infection prevention and control practices ([https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html](https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html)) if a patient is suspected of having COVID-19. They should also notify infection control personnel at their healthcare facility and DHEC if a patient is classified as a PUI for COVID-19. Currently, diagnostic testing for COVID-19 is available at the DHEC Public Health Laboratory and CDC. Below is guidance for specimen collection:

1. Collect upper respiratory tract specimens - nasopharyngeal and oropharyngeal synthetic fiber swabs; place each NP and OP swab in a separate sterile tube containing 2-3 ml of viral transport media.
2. Sputum from a patient with a productive cough may be collected. Induction of sputum is not indicated. Collect sputum in a collection cup or sterile dry container.
3. If the patient is mechanically ventilated, collect a lower respiratory tract aspirate or a bronchoalveolar lavage. Collect 2-3 ml in sterile container.
4. Although samples from both the upper and lower respiratory tract (if available) are recommended, multiple specimens from the same site are not indicated.
5. Refrigerate the specimens at 2-8 degrees C and ship to lab on an ice pack.

Specimen rejection criteria include:
- specimen not kept at proper temperature.
- incomplete/illegible specimen labeling or documentation.
- inappropriate specimen type(s).
- insufficient specimen volume.

Specimens should be collected as soon as possible once a PUI is identified, regardless of the time of symptom onset. For further information, see Interim Guidelines for Collecting, Handling,

If PUIs are well enough to return home, notify them that they will be contacted by DHEC with instructions for isolating at home and to begin identifying contacts who might also have been exposed to the virus. Discharge instructions should include:

- Stay at home, except to receive medical care.
- Separate from other family members and pets as much as possible.
- Call ahead before seeking medical care.
- Cover coughs and sneezes and avoid sharing household items.
- Continue isolating at home until notified by DHEC that it is safe to stop.

DHEC contact information for reportable diseases and reporting requirements

Reporting of Novel Infectious Agents is consistent with South Carolina Law requiring the reporting of diseases and conditions to your state or local public health department. (State Law # 44-29-10 and Regulation # 61-20) as per the DHEC 2020 List of Reportable Conditions available at:

Federal HIPAA legislation allows disclosure of protected health information, without consent of the individual, to public health authorities to collect and receive such information for the purpose of preventing or controlling disease. (HIPAA 45 CFR §164.512).

Categories of Health Alert messages:

- **Health Alert** Conveys the highest level of importance; warrants immediate action or attention.
- **Health Advisory** Provides important information for a specific incident or situation; may not require immediate action.
- **Health Update** Provides updated information regarding an incident or situation; unlikely to require immediate action.
- **Info Service** Provides general information that is not necessarily considered to be of an emergent nature.
